SUMMARY

In recent years, sunflower has become an important oilseed crop in China. There is therefore a need for a distributional bibliography of sunflower pests. An attempt has been made here to list references on insects and mites infesting sunflower in field and storage of China, as exhaustively as possible. Ninety-four sunflower pests have been reported in China. The pest insects and mites have been grouped according to 7 orders and 28 families in this paper. Each sunflower pest is tabulated in accordance with its geographical distribution. All of references are in Chinese.
